## Environment & Climate Action

[Article](#) [Newsroom](#)

Environmental and Climate Action research is tackled by a series of actions and opportunities for collaboration in the Societal Challenges. Climate action, environment, resource efficiency and raw materials. In this context, environmental research aims to achieve a resource, efficient and climate change resilient economy and society.

Environmental Research and Innovation's response to the [Europe 2020 Strategy](#), which identifies smart, sustainable and inclusive growth as a priority to help the EU and the Member States, develops a resource efficient, green and more competitive economy while delivering high levels of employment, productivity and social cohesion. The focus of the EU Research and Innovation programme in environment is challenge-driven, funding the whole research and innovation cycle.

Environmental research and innovation finds its centre of gravity in Horizon 2020's: "Climate action, environment, resource efficiency and raw materials".

OUR FEEDBACK

constrained world while building a resource efficient, sustainable and competitive economy.

As a result it is expected that at least 60% of the overall Horizon 2020 budget should be related to sustainable development and that climate-related expenditure should exceed 35% of the budget, including mutually compatible measures improving resource efficiency.

## Climate Action, Environment, Resource Efficiency and Raw Materials

Article **Newsroom**

Activities in this Challenge will help increase European competitiveness, raw materials security and improve wellbeing. At the same time they will assure environmental integrity, resilience and sustainability with the aim of keeping average global warming below 2° C and enabling ecosystems and society to adapt to climate change and other environmental changes.

This Challenge funds research and innovation with the following specific objectives:

- to achieve a resource – and water - efficient and climate change resilient economy and society,
- the protection and sustainable management of natural resources and ecosystems, and
- a sustainable supply and use of raw materials, in order to meet the needs of a growing global population within the sustainable limits of the planet's natural resources and eco-systems.

The 20th century's era of seemingly plentiful and cheap resources is coming to an end. The ability of the economy to adapt and become more climate change resilient, resource efficient and at the same time remain competitive depends on high levels of eco-innovation, of a societal, economic, organisational and technological nature. With the global market for eco-innovation worth around €1 trillion per annum and expected to triple by 2030, eco-innovation represents a major opportunity to boost competitiveness and job creation in European economies.

## Topic description

### Specific Challenge:

With rising focus on the building sector (e.g. the 'renovation wave' initiative of the European Green Deal) in view of the full decarbonisation by 2050, the built environment remains a strategic domain for R&I. The priority is the design and construction of new or retrofitting of existing buildings as zero-emission/zero-pollution<sup>[1]</sup>, positive energy-houses in sustainable green neighbourhoods. There are two major components in this transition. **Firstly**, a transition in designing and constructing buildings to reduce their embodied emissions and to increase the energy efficiency of their operation; the same applies to retrofitting existing buildings to increase their efficiency. **Secondly**, a transition to energy positive buildings (producing electricity, covering their heating and cooling needs and contributing to the energy grid stability) with sustainable, renewable energy technologies. These two components are closely linked, since greater building efficiency can reduce demand for heating and cooling and allow a greater range of zero emission technologies to become viable. It also means, reducing demand through effective building designs, including those that are adapted to their local environments (bioclimatic architecture conditions) and use. Spreading such building concept allows the creation of green neighbourhood "living labs" (including social housing and non-residential buildings such as hospitals, schools, public buildings, commercial buildings, etc.) with additional urban functionalities (e.g. shared EV charging facilities).

### Scope:

Proposals are expected to deliver at least two (residential and non-residential, new and/or retrofitted) large-scale, real-life demonstrations of promising technology, process and social innovations, in different regions of Europe. The demonstrations should address the following aspects:

- Scalable design of green, positive energy neighbourhoods well embedded in the spatial, economic, technical, environmental, regulatory and social context of the demonstration sites.
- Energy and resource efficient, seamless industrial construction/renovation workflows from design to eventual offsite manufacturing, installation and post-construction monitoring;

### Expected Impact:

Actors along the construction and renovation value chains are qualified and have integrated the innovative technologies in their business models and operations. Strong innovation clusters are able to accelerate the spread of green building and renovation concepts to provide momentum to the 'renovation wave' that will be politically underpinned.

When compared to the state of the art the innovative technical solutions further developed and demonstrated by n the projects are expected to bring the impacts listed below:

- Primary energy savings triggered by the project (in GWh/year);
- Investments in sustainable energy triggered by the project (in million Euro);
- Demonstration sites that go beyond nearly-zero energy building performance;
- High energy performance (nearly zero-energy level within the meaning of Directive 2010/31/EU for retrofitted / positive-energy level buildings for new constructions);
- Reduction of greenhouse gas emissions towards zero (in tCO<sub>2</sub>-eq/year) for the total life-cycle compared to current situation shown through cradle-to-cradle Life Cycle Assessment;
- Reduction of the embodied energy in buildings by 50 % without concessions with respect to energy consumption and comfort;
